"Fluctuation of the Reduced Glutathione Level of Erythrocytes After Gall Bladder Surgery."

Budapest, Magyar Sebeszet, Vol XVI, No 4, Aug 1963, pages 243-246.

Abstract: [Authors' Hungarian summary] The reduced glutathione level of erythrocytes and the glutathione index have been tested before and after operation in 42 cases of gall bladder and 11 cases of other abdominal surgery. Depending on the kind of surgery performed, both values showed an increase 2-3 days after the operation which was followed by a decrease in the values. Normal equilibrium was reestablished only 1-2 weeks later. In cases of inflammation or carcinoma, this increase was absent and a decrease of the values was noted instead. The phenomena can be explained by the state of stress of the liver cells and by their increased outflow. In states of chronic stress the production and outflow can not be increased further. All 16 references are Western.

"Visceral Tetany as One Cause of Biliary Dyskinesia."

Budapest, Orvosi Hetilap, Vol 107, No 48, 27 Nov 66, pages 2269-2271.

Abstract: [Author's Hungarian summary] In the course of study of 307 patients, seen in a 5-year period between 1960-65, with complaints of "gall bladder colic", the symptoms were presumably caused by visceral tetany in 25 (8.3 per cent) and were proven to be caused by visceral tetany in 10 (3.3 per cent) of the cases. All of the patients with tetanic biliary dyskinesia were women. Among the patients with hypoparathyroidism (idiopathic and strumiprivoous) treated during the same period, 57 per cent also complained of the same symptom. On the basis of the above findings, biliary dyskinesia is considered to be a rather frequent and important sign of visceral tetany. All 15 references are Western.

66 Calculation of discharge into wells with variable
permeability coefficient. - G. Szilagyi. (In:
Acta Hydrochimica et Hydrobiologica Hungarica, 1954, No. 1, pp. 1-10; see figure
8, table.)

In the calculation of well discharge, e.g. by the Darcy or Leqger formulae, permeability coefficient k is considered constant though it has been pointed out by some authors that k varies with the velocity of ground water movements. To determine the variable coefficient of permeability the author introduces the concept of the hydrodynamically equivalent porosity diameter (d_e), determined by the Hagen-Poiseuille formula from the data of pumping experiments. The relation between velocity (v) to porosity diameter (d_e) can be graphed in most cases in a double logarithmic system by a straight line. On the basis of v_2 determined experimentally and of d_e read from the diagram the

permeability coefficient is calculated by formula $k = \frac{\pi}{32} \frac{v^2}{\nu} d_e^2$ where π is the porosity ratio of the aquifer,
 v the acceleration by gravity, and ν the kinematic viscosity. Check calculations executed with the variable permeability coefficient have given results approaching the observed data.

PROCESSES AND PROPERTIES INDEX																																																																																																			
SZILAGYI, Imre <i>Preparation and therapeutic value of calcium levulinic acid.</i> Tibor Vályi-Nagy, Imre Szilágyi, and József Uri (Tudományegyetemi Gyógyszerfani Intézet, Debrecen, Hungary). <i>Orosz Hetilap</i> 89, 200-4 (1948).—Three kinds of calcium levulinate can be prepd. Crystn. of supersatd. aq. solns. and sepn. of the crystals of the mother liquor with subsequent drying at 50-60° gave a substance (I) with 2 mol. of water of crystn. and 300.3 mol. wt., formula $C_{10}H_{14}O_5Ca$, with 13.08% Ca content. If Ca levulinate is crystd. out of a mixt. of water and an org. solvent miscible with water and the product is dried after centrifuging under vacuum at room temp. in presence of a water-absorbing substance a similar compnd. (II) with mol. wt. 288.4, Ca content 13.90%, and formula $C_{10}H_{12}O_5Ca$ is obtained. It seems to be stable and well adapted for the prepn. of solns. for injection. II is unstable in air and rapidly absorbs moisture until it reaches a compnd. identical with that of I. Drying either I or II at 60° under vacuum for 16 hrs. produces anhyd. Ca levulinate (III), m. 55-60°, mol. wt. 270.3, Ca content 14.83%, formula $C_{10}H_{10}O_5Ca$. When heated I seemed to lose the first mol. of water of crystn. much more easily than the second mol. Expts. on dogs proved that injections of 10-15% solns. of Ca levulinate intramuscularly causes no pain reactions. The Ca level of the blood increased in 30-210 min. by not more than 2.30-3.65 mg. %. Ca gluconate applied under like conditions caused max. increases of 1.25-0.80 mg. %. The increase of blood pressure effected by injections into the vein femoralis of a 10% soln. of Ca levulinate ranged between similar effects caused by 10% solns. of $CaCl_2$ and Ca gluconate. Ca levulinate was also tested on human beings and seemed to be a safe Ca prep., without any local exciting effects. <i>István Finlay</i> 12 references.

Method to purify and to remove sulfur from the raw gases produced from lignite. Imre Szilagyi, Magyar Kém. Lapja 4, 24-5 (1949).—Lignite of Várpalota is worked up to raw gas at the nitrogen and fertilizer plant at Pétfürdő. The gases generally contain 10 g./cu. m. H₂S. An active carbon app. serves to remove sulfur. The S is dissolved by ammonium sulfide and the soln. of polysulfides obtained is distil. at about 120°C. The distg. column is working continuously; and the melted S is fed off at the base. The app. yields daily 2000 kg. S. Ammonium sulfide is prep'd. by absorbing the H₂S-contg. waste gases of the plant producing CS₂ in a liquid contg. ammonia. István Finlay

1949, 79/17 (260-264) Graphs 3 Tables 2

The preparation of calcium laevulinate containing no, one mol., and two mol. crystal
water is described. Only the third preparation is stable. It causes no pain on
intramuscular injection. In cats it raises the blood pressure slightly, and in dogs
the same effect is obtained after a transient depression. Calcium laevulinate raises
the blood calcium level more than does the same dose of calcium gluconate.

✓ Primycin, a new antibiotic. T. Váyi-Nagy, J. Úri, and I. Szilágyi (Univ. Debrecen, Hung.). *Nature* 174, 1105-6 (1954).—Actinomycetes isolated from the intestinal tract and feces of larva of the wax moth (*Galleria mellonella*) produced an antibiotic, primycin (I), $C_{14}H_{17}O_3N$, when grown on an aik. liquid medium contg. 2-4% corn steep liquor and 1% glucose for 6 to 9 days. Impure I was obtained from cultures by acidification to pH 2.5 to 2.8, filtering the ppt., and extg. with MeOH. Impurities were removed from the MeOH soln. by adsorption on $Al(OH)_3$ and I pptd. with Et₂O. Soln. of this ppt. in 20% aq. MeOH, extn. with BuOH, and the exts. pptd. with Et₂O gave I, recrystd. from MeOH-BuOH, m. 166-8°. I was active against *Micrococcus pyogenes* var. *aureus* in concns. of 0.02 to 0.06 γ/ml. I was bacteriostatic against gram-pos. organisms and Mycobacteria, and had some viricidal action. Serum reduced the potency of I to 1/4 or 1/4. The L.D. for mice and rats was 2.5 and 10 mg./kg., resp. I is not identical with known antibiotics.

The Fries rearrangement of phenolic esters. T. Széll, A. S. Burka, and I. Szilágyi (Univ. Szeged, Hung.). J. Sz. Ind. Research (India) 18B, 323-5 (1959); cf. following abstr.—Expts. to correlate the resistance of phenolic esters to acid hydrolysis with the ease with which these underwent Fries rearrangement showed that in the case of esters from a single phenol and different acids, the greater the resistance of the esters to hydrolysis, the more difficult it was for them to undergo the Fries rearrangement. E.g., the order of resistance to acid hydrolysis for 2- and 4-nitrophenyl acetates, benzoates, and propionates was: benzoate > propionate > acetate, whereas it was the reverse as regards their capacity to undergo Fries rearrangement. In the case of esters formed from different phenols and a single acid, however, this correlation was not observed, e.g. thymyl acetate which gave a β -hydroxy ketone in 65-75% yield was more stable to acid hydrolysis than 2-nitrophenyl acetate, which gave only 30% of the β -hydroxy ketone. This behaviour of the esters was in accordance with the mechanism of the Fries reaction as explained by Ogata, et al. (C.A. 41, 6567d). The phenolic esters were hydrolyzed in 50% aq. alc. with 0.1*N* HCl at 70°, the rate of hydrolysis being followed by detn. of the unhydrolyzed ester at regular intervals. In the case of nitrophenolic esters, the samples were treated with 2 cc. of ice-cold buffer soln. (prepd. by mixing 89.9 cc. of Na₂HPO₄ soln. (11.87 g. of Na₂HPO₄·2H₂O/l.) with 10.1 cc. of KH₂PO₄ soln. (9.08 g. of KH₂PO₄/l.), and the concn. of nitrophenol in the reaction

mixt. detd. photometrically. Fries rearrangement of some nitrophenolic esters: *Ibid.* 328-8.—Contrary to the observation of Lindemann and Romanoff (C.A. 24, 91), 2-O₂NC₆H₄OAc (I) has been found to undergo Fries rearrangement to 4,3-HO(O₂N)C₆H₄Ac (II) with an equimolar amt. of AlCl₃, even in the absence of a solvent. A mixt. of II (10 g.), prep'd. by the method of Brown (C.A. 40, 4042¹) and 6.7 g. anhyd. AlCl₃ heated 25 hr. at 100°, decompd. with 35 cc. ice and 8 cc. HCl, allowed to stand 24 hrs., extd. thrice with warm C₆H₆ and twice with C₆H₄, and treated with 2.5 g. PhNHNNH₂ gave 17.8 g. II phenylhydrazone, m. 193-4°. Similarly, in the presence of PhNO₂ as a solvent, 2-O₂NC₆H₄OOCET and 4-O₂NC₆H₄OOCET (III) (2,4-di-nitrophenylhydrazone, m. 243-4°) were isomerized to 4,3-HO(O₂N)C₆H₄COET, m. 58-61° (phenylhydrazone, brick-red/needles, m. 110-12°; 2,4-dinitrophenylhydrazone, m. 218-19°), and 2,5-HO(O₂N)C₆H₄COET m. 93-4° (phenylhydrazone, lemon-yellow, m. 189-90°; 2,4-dinitrophenylhydrazone, m. 230-2°), resp. III, converted to its Na salt and treated with BzCl in C₆H₆, gave 2,4-BzO(O₂N)C₆H₄COET (IV), m. 51-2° (petr. ether), in 92% yield. 2,4-BzO(O₂N)C₆H₄Ac (V), 3-O₂NC₆H₄OOCCH₂Cl (VI), and 3-O₂NC₆H₄OOCCH₂Ph (VII) were prep'd. likewise by the reaction, in C₆H₆, of the Na salt of the corresponding nitrophenol with the appropriate acid chloride and m. 104°, 76-8°, and 61-3° (all from EtOH), resp. However, all attempts to carry out Fries rearrangement of IV, V, VI, and VII by refluxing them 2-8 hrs. at 125° in the presence of 1.5 to 5.0 moles of anhyd. AlCl₃ failed. S. B.P.

SZILAGYI, I

Conductivity of phenolic esters in nitrobenzene solutions containing aluminum chloride. Tamás Széll, Árpád Furka, and István Szilágyi (Univ. Szeged, Hung.). Naturwissenschaften 46, 490-1 (1959) (in English).—The resistance of 19 phenolic esters (phenyl, 2-, 3-, and 4-nitrophenyl, 1-naphthyl, *m*-tolyl-, *p*-tolyl-, thymyl acetate and propionate, 3-nitrophenyl propionate, chloroacetate, and phenylacetate) were measured in PhNO₂ in the presence of AlCl₃ and AlCl₃ + HCl. The solns. were prep'd. by dissolving 3 milli-

moles of ester and 3.6 millimoles of anhyd. AlCl₃ in 15 ml. of freshly distd. PhNO₂ at 24°. The resistance of pure PhNO₂, PhNO₂ + AlCl₃, and PhNO₂ + AlCl₃ + HCl (satd.) were 1.46 Mohms, 520 ohms, and 440 ohms, resp. The resistance of the solns. contg. the phenolic esters in the AlCl₃ alone ranged from 350 to 1250 ohms, whereas in the presence of HCl these values decreased by 50 to 550 ohms, the decrease being strongly time-dependent.

of surface water resources* (in Hungarian, with French, German,
Hungarian, and English summaries), *Vitányi Közlemények* no. 1, 3-
71, (4)-(14), 1952.

This subject, part of a postgraduate course for engineers in hydrology, is comprehensively treated, with practical examples of Hungarian rivers and extensive references to determine the country's water resources for optimum utilization. Graphical methods and their theoretical basis are presented for determining the rating curve of river flows when data (river levels at known instants at given time intervals) are insufficient, scattering, or inadequate. The evaluation of discrepancies, often due to disturbances such as flash flood, backwater, shifting channel, unsteady flow, etc., etc., is pointed out, thus enabling engineers who are making the rating curve to improve their approach and to instruct the technicians taking the data. ✓ 3641. Szilagyi, J., and Muszkay, L., Effect of ice cover on river discharge (in Hungarian), Res. Inst. for Water Resources, Budapest, 1954 Report, 80-90, 1955.

Correction factor $\varphi = Q/Q_0$, used for determination of a winter discharge from the discharge curve for open channel, is studied as function of two arbitrary arguments: (1) a relative discharge $q = 100(Q - Q_{\min}) / (Q_{\max} - Q_{\min})$, (2) a characteristic factor for every cross section $c = b_m(A)^{1/2}/B v_m e_m$, where b_m is average depth, A area of cross section, B surface width, v_m average velocity in open channel, undisturbed by the ice cover, e_m average ice thickness. Values for a varied between 0.3 and 5.7 (in metric units). A diagram gives the values of φ as a function of q and a . Method can be applied for stations with insufficient observational data.

"Complete Postoperative Opening of the Abdominal Wall."

Budapest, Magyar Sebeszet, Vol XVI, No 3, June 1963, pages 145-151.

Abstract: [Authors' Hungarian summary] The authors discuss postoperative eventeration and present 3 cases observed by them. The factors which might play a role in eventeration are presented. The first part of the article presents the factors which might weaken the scar or suture-line, the second part deals with the factors which increase the pressure in the abdomen. The procedures aimed at decreasing further the occurrence of eventeration are discussed. 19 Eastern European, 11 Western references.

TITLE: Amino acid distribution in cerebrospinal fluid I. Arginine

SOURCE: Ideggyogyaszati szemle, no. 1, 1966, 14-18

TOPIC TAGS: arginine, serum, biochemistry

ABSTRACT: Colorimetric determination of arginine was carried out on cerebrospinal fluid and serum which were found to be normal by routine laboratory testing methods. It was found that the contradictory values found in the world literature can presumably be explained by the site chosen for puncture and the amount of fluid removed since the arginine content of the cisternal fluid was found to be higher than that of the lumbar fluid. A correlation was found to exist between the arginine level of lumbar fluid and the serum arginine level in the same individual. There appears to be a numerical correlation between age and the fluid arginine content (decreasing gradually with increasing age); however, this correlation could not be proven statistically. 36. Introduction of prefabricated elements at the installation of lighting in cell type high-tension switchgear equipment. - Elszereltető elem bevezetése nagyrésztűn cellás erőrendszer szétszélel... J. Szilágyi and Gy. Tolnay. (Electricity - Villamosság Vol. 21 1954, No. 1-2, pp. 52-55; 3 fig.)

The authors describe the usual methods of laying lighting wires in high tension cell arrangements, stating their advantages and disadvantages. A new arrangement is recommended for eliminating the shortcomings of the methods used until now. The tubes of the distributing mains leading along the cell corridor are laid into the threshold of the cells. The tubes of the taps leading to the lights are placed into the inner side of iron section plates protecting the edges of the cell walls. Both ends of the iron section plates can be designed for prefabricated connection boxes, so the upper end the lighting fixture can be fixed, while the connecting wires can be led into the lower one. The lower box is also suitable for the installation of a plug-in socket.

"Acute Intermittent Porphyria."

Budapest, Magyar Sebeszet, Vol XIX, No 2, Apr 66, pages 121-123.

Abstract: [Authors' German summary] On the basis of a few cases reported, attention is called to the surgical aspects of acute intermittent porphyria. It is recommended that, in cases of non-specific abdominal complaints, the "inverse aldehyde reaction" be carried out among the routine urine tests; it is simple and easy to carry out, and may clarify the diagnosis. As seen in one presented case, the finding of an increased amount of porphyrine does not, of course, exclude the possibility of the concurrent presence of an acute surgical illness. 7 Hungarian, 11 Western references.
